

1. Perform descriptive analytics to create a customer profile for each AeroFit treadmill product by developing appropriate tables and charts.
2. For each AeroFit treadmill product, construct two-way contingency tables and compute all conditional and marginal probabilities along with their insights/impact on the business.

```
Out[6]: (180, 9)
```

In [7]: `df.info()`

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 180 entries, 0 to 179
Data columns (total 9 columns):
#   Column          Non-Null Count  Dtype
---  -
0   Product         180 non-null    object
1   Age             180 non-null    int64
2   Gender          180 non-null    object
3   Education       180 non-null    int64
4   MaritalStatus   180 non-null    object
5   Usage           180 non-null    int64
6   Fitness         180 non-null    int64

Outliers:

1. Age: the mean is at 28 and median is at 26 which is not a large gap. the age column seems to have outliers after 46 years of age. A more detailed view of outliers can be found further in the case study with use of boxplots.
2. We can see that there is not a big gap in mean and median in all the columns with numeric values. we could conclude that we dont have too many outliers from this observation.
3. Salary values are ranging from 29k to 104k.

```
In [9]: df['Usage'].unique()
```

```
Out[9]: array([3, 2, 4, 5, 6, 7])
```

```
In [10]: df['Education'].unique()
```

```
Out[10]: array([14, 15, 12, 13, 16, 18, 20, 21])
```

--> checking no of unique values we have in some columns will help us understand the range of values and what kind of data it is and what kind of plots/tables can be created from that data.

>> Distribution of of each product

```
In [11]: data = df['Product'].value_counts()  
labels = df['Product'].value_counts().index  
plt.pie(data, labels=labels, autopct='%0.0f%%')  
plt.show()
```

Insight:

1. we can note that the product KP281(entry level treadmill) is the most bought product in Aerofit, followed by KP481 and then KP781.

>> Product-type vs Gender

```
In [12]: ct2 = pd.crosstab(df['Product'],df['Gender'])
          ct2
```

```
Out[12]:
```

	Gender	Female	Male
Product			
KP281		40	40
KP481		29	31
KP781		7	33

```
In [13]: # probability that a male customer bought any product
          ((ct2['Male'].sum()/(ct2['Female'].sum()+ct2['Male'].sum()))*100).round(2)
```

```
Out[13]: 57.78
```

```
In [14]: # Probability that a male customer buys the model KP781

((ct2.loc['KP781','Male']/ct2.loc['KP781'].sum()*100).round(2)
```

Out[14]: 82.5

```
In [15]: # probability that a customer buys the models KP281/KP481 given that she

(((ct2.loc['KP281','Female'] + ct2.loc['KP481','Female'] )/ct2['Female']).
```

Out[15]: 90.789

Insights:

1. It can be noted that a male customer is slightly more likely to buy a product than a female customer
2. specifically for the product KP781, it is highly likely that a male customer will buy it. In other words, a female customer is more likely to buy the models KP281/481

>> Income distribution for each Product type

```
In [16]: sns.histplot(data=df,x='Income',hue='Product',stat='percent',bins=8,kde=True,plt.show())
```

Insights:

Note: Although the color coding of the stacked bar chart is confusing, we are using the color coding of KDE plot lines to understand the contribution of income towards each product.

1. The entry level product is most popular among lower income groups (from 30k - 58k annual salary)
2. The high-end product (KP781) is seen to have steady contributions from customers with income from 50k to 100k with more contribution in 50k-58k and 88k-94k ranges.
3. the mid range product(KP481) is popular among customers with incomes from 30k - 68k.
4. We could infer from the data we see that customer with income above 70k are most likely to buy only KP781 (the high end model).

```
In [17]: sns.boxplot(data=df, x='Income', y='Product')  
plt.grid()  
plt.show()
```

Insights:

1. the model KP781 is being preferred by customers whose annual income is in the range of 60k to 90k
2. the models KP281 and KP481 are being preferred by customers whose annual income is in the range of 40k-54k, whereas the model KP281 is being preferred by the lower end of this income group (39k-45k).
3. We do not have a lot of outliers for income groups which indicates that customer behaviour is consistent with a general hypothesis that lower income group customers will go for lower priced products.

```
In [18]: sns.histplot(data=df,x='Age',hue = 'Product',stat='percent',bins=8,kde=True)
plt.grid()
plt.show()
```

1. We could include kde to understand how much each age is cotributing to a particular product.
2. Here, we can note that from age 22 to 32, at any given point percent of KP281 models bought are higher than KP481 and percentage of KP481 models bought is greater than KP781.

>> Effect of age on each product category

```
In [19]: sns.boxplot(data=df,x='Age',y='Product')
plt.grid()
plt.show()
```

Insights:

1. the spread of age for the model KP781 is 25 to 30 years old.
2. there are a lot more outliers for the product KP781 they lie between ages 40 to 50.
3. the median age for buying the models KP281/481 is similar and is 26.
4. the spread of data for KP281/481(24-34) is more compared to the spread for model KP781(25-30).

>> Marital status distribution

```
In [20]: sns.countplot(data=df,x='MaritalStatus',hue='Product')
plt.xlabel("Marital Status")
plt.ylabel('Count')
plt.grid()
plt.show()
```

```
In [21]: ct1 = pd.crosstab(df['Product'], df['MaritalStatus'])
ct1
```

```
Out[21]: MaritalStatus  Partnered  Single
```

Product		
KP281	48	32
KP481	36	24
KP781	23	17

```
In [22]: # Percentage of couples buying KP781
```

```
((ct1['Partnered'].loc['KP781']/ct1.loc['KP781'].sum())*100).round(2)
```

```
Out[22]: 57.5
```

```
In [23]: # Percentage couples buying KP281 or KP481
```

```
((ct1['Partnered'].loc['KP281']+ct1['Partnered'].loc['KP481'])/(ct1.loc[
```

```
Out[23]: 60.0
```

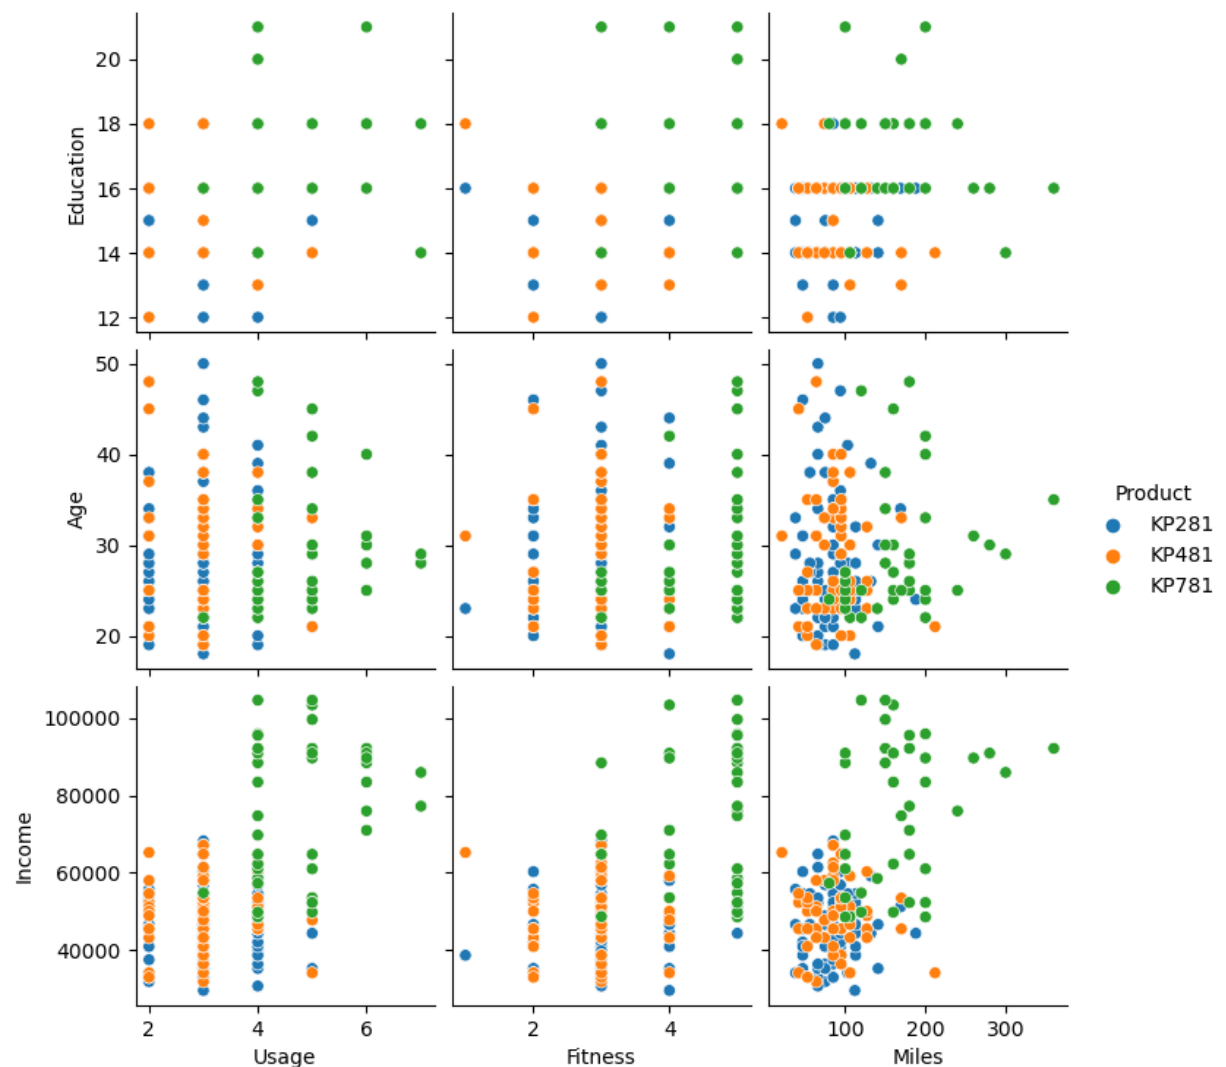

Insights:

1. We can note from the graph that there are more no of 'partners' who are buying treadmills in general compared to single customers.
2. The difference in single and partnered customer buying KP281 and KP481 is more significant than KP781.
3. We can deduce from the above table that Couples are more likely to buy the models KP281/481

>> Fitness, Usage and Miles

In [24]: `sns.pairplot(df, x_vars= ['Usage', 'Fitness', 'Miles'], y_vars = ['Education',`

Out[24]: `<seaborn.axisgrid.PairGrid at 0x7fda49d260d0>`

>> Fitness distribution for each product

```
In [25]: sns.countplot(data=df,x='Fitness',hue='Product')  
plt.show()
```

Insights:

1. customers who are atleast moderately fit (≥ 3) are likely to buy the KP781 model
2. customers who are fit (rating = 5) are more likely to buy the model KP781
3. customers who self-rated their fitness to be 4 seem to be equally divided between all three product types.

```
In [26]: # Self rated fitness level vs Product bought  
  
ct4 = pd.crosstab(df['Fitness'],df['Product'])  
ct4
```

Out[26]: **Product** KP281 KP481 KP781

Fitness			
1	1	1	0
2	14	12	0
3	54	39	4
4	9	8	7
5	2	0	29

Probability that self-rated fitness LESS THAN OR EQUAL TO 3 given that the customer bought KP281

In [27]: `(ct4.loc[1, 'KP281'] + ct4.loc[2, 'KP281'] + ct4.loc[3, 'KP281']) / ct4['KP281'].sum()`

Out[27]: 0.8625

Probability that self-rated fitness LESS THAN OR EQUAL TO 3 given that the customer bought KP481

In [28]: `(ct4.loc[1, 'KP481'] + ct4.loc[2, 'KP481'] + ct4.loc[3, 'KP481']) / ct4['KP481'].sum()`

Out[28]: 0.8666666666666667

Probability that self-rated fitness LESS THAN OR EQUAL TO 3 given that the customer bought KP781

In [29]: `(ct4.loc[1, 'KP781'] + ct4.loc[2, 'KP781'] + ct4.loc[3, 'KP781']) / ct4['KP781'].sum()`

Out[29]: 0.1

Probability that self-rated fitness EQUAL TO 5, given that the customer bought KP781

In [30]: `ct4.loc[5, 'KP781'] / ct4['KP781'].sum()`

Out[30]: 0.725

Insights:

1. 86.26 percent of customers who think they are low to moderately fit (fitness <= 3) purchase low end model like KP281. The percentage for KP481 is the similar (86.6%) with customers whose fitness is rated to be <= 3.
2. 72.5 percent of customers who rate themselves to be in excellent shape buy KP781.

>> expected Usage vs Product

```
In [31]: ct5 = pd.crosstab(df['Usage'],df['Product'])
         ct5
```

```
Out[31]: Product  KP281  KP481  KP781
         Usage
         2         19         14         0
         3         37         31         1
         4         22         12         18
         5          2          3         12
         6          0          0          7
         7          0          0          2
```

Probability that Usage LESS THAN 4 given that the customer bought KP781

```
In [32]: (ct5.loc[2,'KP781']+ct5.loc[3,'KP781'])/ct5['KP781'].sum()
```

```
Out[32]: 0.025
```

Probability that Usage IS LESS THAN OR EQUAL TO 4 given that the customer bought KP481

```
In [33]: (ct5.loc[2,'KP481']+ct5.loc[3,'KP481']+ct5.loc[4,'KP481'])/ct5['KP481'].s
```

```
Out[33]: 0.95
```

Probability that Usage IS LESS THAN OR EQUAL TO 4 given that the customer bought KP281

```
In [34]: (ct5.loc[2,'KP281']+ct5.loc[3,'KP281']+ct5.loc[4,'KP281'])/ct5['KP281'].s
```

```
Out[34]: 0.975
```

Insights:

1. Customers with expected usage < 4 , the probability that they buy for KP281/481 is around 95% with is very high.
2. Customers with usage > 5 , bought exclusively KP781 model.
3. While the Expected usage of 4 times per week had a mix of customers buying all three models, customers with expected usage of 5 were more inclined to buy model KP781.

Expected miles per week vs Product

```
In [35]: sns.histplot(data=df,x='Miles',hue = 'Product',bins=10,kde=True)
plt.show()
```

```
In [36]: df_miles= df.loc[df['Miles'] <= 125]
df_miles
```

Out[36]:

	Product	Age	Gender	Education	MaritalStatus	Usage	Fitness	Income	Miles
0	KP281	18	Male	14	Single	3	4	29562	112
1	KP281	19	Male	15	Single	2	3	31836	75
2	KP281	19	Female	14	Partnered	4	3	30699	66

```
In [40]: df_miles1[df_miles1['Product'] == 'KP781'].shape[0]/df_miles1.shape[0]
```

```
Out[40]: 0.6666666666666666
```

Insights:

1. A customer who expects to run more than 125 miles per week is more likely to buy KP781 than other models.

>> Correlation/Heatmap

```
In [41]: sns.heatmap(df.corr(),annot=True)
plt.show()
```

1. Income and Education, Fitness and Usage, Usage and Miles are positively correlated.

>> Customer profiling

KP281 :

1. A female or a male customer almost equally likely to buy this model
2. This model is popular with customers of ages from 23-33
3. Popular among customers with fitness rating 2,3 and 4 with male customers
4. Bought by customers whose median education is less than or equal to 16 and annual income $\leq 60k$.
5. A customer's typical usage is less than or equal to 5 times a week and runs less than 125 miles per week.

KP481:

1. Preferred by customer who workout 2-5 times a week
2. Their self evaluated fitness rating is less than or equal to 4.
3. They run less than 125 miles per week.
4. Their median education is less than 16 and annual income is below 75k.

KP781:

1. They expect to use the treadmill at least 4 times a week.
2. They have a self evaluated fitness level of 4 or 5.
3. They expect to run at least 125 miles per week.
4. The customers who buy KP781 treadmills are most likely males, aged 24 to 30.
5. Their median education is greater than 16 years
6. Even though a customer's salary is around the median, if he/she is fit and expects to use the machine more often, they are more likely to buy this model.

>> Business recommendations:

1. Men are almost equally likely to buy any of the three products but women are more likely to buy KP281 and KP481. Hence KP781 is more likely to be bought by a man than a woman.
2. The median education in years is 16. Customers who belong mostly to the segment of customer with education below 16 years, they are more likely to buy KP281 and KP481.
3. The salary/annual income range for most customers who purchase KP281 or KP481 lies between 30k to 54k, whereas the customers who purchase KP781 have salary range of 58k to 92k.
4. Assuming that the profit margins for high end models are higher, we could upsell KP481/781 to customer whose fitness = 4 and usage = 4, which means that they have already been working out for a while. They could be persuaded to buy a higher end model that can provides more features.
5. Since it is no definitive guide on to tell how much a customer earns or how educated a customer is just by looking at them (taking into account risk of not being able to profile the customer correctly), it is best to rely on the these three factors; Fitness, usage and miles. If a customer rates him/herself 4 or 5 out of 5 or expects to use frequently, we could show him a model with advanced features.
6. There are more partnered customers than single customers and the overall sales of KP281 is more than KP481, which is more than KP781 for wither of the category.
